Cluster - A group of points of interest (POIs). They could be based on factors like venue type or visitor purpose.

Home Zip Code - The home zip code of the device. It's calculated by observing the historical patterns of the device and is updated monthly, based on the behavior of that device.

Census Demographics - We calculate the home zip code of the device and then link that user's demographics, social, housing, and economic characteristics by using data from the U.S. Census and American Community Survey.

Repeat vs One Time - A measurement that can span multiple years to monitor if a device is observed in a destination one or more times. Once a unique device is observed in the destination a second time, that visitor shifts from a one-time visitor to a repeat visitor.

Household Level Demographics - Reports on income, education levels and age brackets of everyone living in a household. For example, if one person from the household visits a POI, the entire household profile would be reported. In other words, the demographics of a visitor are based off the demographics of their household, as opposed to the individual person in the POI.

POI (Point of Interest) - A physical boundary drawn on a map that is used to capture mobile device activity within that boundary. These are customizable and set by the user.

Trips - The number of distinct trips by a visitor to a destination or POI. We calculate this using a combination of observation patterns and distance traveled. For example, if a visitor comes in-market Thursday - Sunday, it only counts as one trip. If they return later in the month, that is counted as a second trip.

Household Level Demographics - Reports on income, education levels and age brackets of everyone living in a household. For example, if one person from the household visits a POI, the entire household profile would be reported. In other words, the demographics of a customer are based off the demographics of their household, as opposed to the individual person in the POI.
